Introduction

Explain what R is and how its package ecosystem works. Points:

- Open source project, where many people contribute with their own extensions
- Large variation in the quality of different extensions (packages)
- That some R users, particularly new ones, struggle with finding and picking which packages to use.

11

Ideas of 10 things Finding packages:

- CRAN task views
- Textbooks ("[x] with R"). May not be latest...
- Google searches, social media (#rstats)
- Conferences (and online streams of those). RStudio, UseR.

Picking a good package:

• On a public repository like CRAN or Bioconductor. Explain more about these repositories and what their standards are. Explain their role in the community. Give the alternative ways that R packages can be shared (GitHub, zipped file posted somewhere else). How these regularly check code and help with managing the web of dependencies.

st Corresponding author: Brooke.Anderson@colostate.edu

- Quality of the documentation. Types of documentation (help files, vignette, packagedown website, bookdown book).
- Coverage by tests. Explain about unit testing and how it can help control quality.
- Peer review. ROpenSci. Associated with a peer reviewed paper. Associated with a book put out by a scientific publisher?
- Looking up package authors. Is there role in R development (RStudio, some big bio labs)? Is the work part of their work from an academic lab? Do they have a history of a lot of R development? GitHub profile. Google scholar profile. Also, is it a team of developers? Robust team?
- Evidence of established package. Lots of version. Clear NEWS providing explanations of changes. History of Issues and those being resolved.
- Exploring the code yourself. How open source framework provides this. GitHub mirror of CRAN if you don't want to download the zipped package file yourself.

Here are two sample references: [1,2].

Introduction

R is a language and environment for statistical computing and graphics that was developed by statisticians and is collaboratively maintained by an international core group of contributors. Unlike many popular proprietary languages (e.g., MATLAB, SAS, SPSS), R is highly extensible, free and open-source software; the user can access and thus change, extend, and share code for desired applications. Accordingly, a vibrant community of R users has emerged, many of which engage in the development of extensions to the functionality of base R software known as packages. A prominent contributor in the R community, Hadley Wickham, views functional programming as analogous to following a recipe; to conceptualize packages, imagine R is the kitchen and packages are the special gadgets which allow you to cook and bake new recipes. R packages are coding delectables that enable the user to perform practical tasks (e.g., wrangling and cleaning data frames, designing interactive apps for visualizing data, performing dimensionality reduction) and solve problems (e.g., training regression and classification models, assessing the beta diversity of a population, analyzing gene expression microarray data) with interesting techniques.

As a natural consequence of the open-source nature of R, there is variation in the quality of different packages among the numerous choices that exist. The advanced R user—having developed an intuition for their workflow—may tend to be relatively confident when searching for and selecting packages. By contrast, a common experience that characterizes learning R at the outset is the struggle to 1) find a package to accomplish a particular task and 2) choose the best package to perform that task. Even so, there remain obscure and complicated problems that morph selecting an R package into a barrier despite experience.

In coding as in life, we endeavor to make choices that optimize outcomes. Just as one may go about shopping for shoes, deciding which graduate program to pursue, or conducting a literature review, there is a science behind selection. We inform our decisions by assessing, comparing, and filtering options based on indicators of quality such as utility, association, and reputation. Likewise, choosing an R package requires attending to similar details. We outline ten simple rules for finding and selecting R packages so that you will spend less time searching for the right tools and more time coding delicious recipes.

June 12, 2020 2/5

List of 10 rules (currently in no particular order and not precisely worded) 1. Consider your purpose • What do you want to use the package to accomplish? • features functions organization • package description • compare similar options 2. Spend time searching; find and collect options • internet searches (keyword "...in R") • textbooks ("[x] with R" series) • tutorials • courses • social media (#rstats) • conferences (e.g., RStudio, useR!) • consult collaborators • CRAN task views • Research articles - Check which packages have been used in research in your field (provide suggestions for good Google Scholar search queries to identify papers that have used certain packages or that present a package) Alternatively, check the Methods and References sections of papers in your field. - Related to that, we could talk about how packages can be cited (the citation function produces one in the preferred format for any package). You can look up most packages in Google Scholar to see how many times it's been cited by looking at the "Cited by" link with the reference. See for example the first listing at https://scholar.google.com/scholar?hl=en&as_sdt=0%2C6&q=dplyr&btnG= • Blogs - posts with overviews of new packages - Joe Rickert of RStudio used to regularly highlight interesting new packages (check to see if he still does). - Mara Averick of RStudio advertises cool new R things; check if any focus on packages. 3. Check how it's shared • check repository association - CRAN - Bioconductor - GitHub - GitLab (alternative to GitHub) - ROpenSci (runs its own repository, only includes ones it has peer-reviewed) - Self-hosted repositories (can be made with the drat package; see paper)

- purpose of repositories: mechanisms of quality control that regularly check

code and manage webs of dependencies

•	alternative ways R packages can be shared (not repo)	113
	- zipped file	114
	- collaborators	115
4.	Explore the availability and quality of help	116
•	help files	117
	help()	118
	vignettes	119
	DOCUMENTATION file	120
•	"cheatsheets" from RSudio	121
•	RDocumentation (key word search, task views)	122
•	websites (e.g., packagedown)	123
	bookdown books	124
	compare documentation completeness and resource quality	125
	find ways to get help beyond initial documentation	126
	listservs	127
	online communities	128
	Stack Overflow (frequency of questions and answers on the topic)	129
	See if GitHub repo for the package seems responsive to Issues Rcpp is an example of high-quality help	130
•		131
	- associated book	132
	- maintainer, Dirk, is known to be responsive to user questions (listserv)	133
	 ample documentation including examples to get started 	134
5.	Verify the credibility of the author(s)	135
•	team or single author (robust team?)	136
•	associations (e.g., academia, industry, labs)	137
•	expertise	138
	reputation	139
	experience (e.g., portfolio of packages, history of R development)	140
	role in R development (e.g., RStudio, regarded bio labs)	141
•	profiles (e.g., GitHub, Google Scholar, Research Gate, Twitter)	142
6.	Investigate the package development	143
•	best practices	144
	unit testing (manage quality control)	145
•	dependencies	146
•	coverage by tests	147
•	number of versions	148
•	(I - I - I - I - I - I - I - I - I - I	149
•	GitHub Issues (history, resolution)	150
7.	Read, research literature, seek evidence of peer review	151
•	publications	152
	package itself	153
•	papers about the package	154
	ROpenSci	155
•	associations with books or publications from scientific publishers	156
8.	Quantify how established the package is	157

June 12, 2020 4/5

• dependencies	15
• versions	159
updatesnumber of downloads	16
	16
popularityleaderboard	16
• ranking systems	16
9. Put the package to the test	16
• explore code	16
interact with trial and errorget a feel for using it in context of your goal	16
• open-source framework	16
• GitHub mirror of CRAN as an alternative to downloading zipped package file	17
• How interoperable it is with other packages that you want to use?	17
• some packages do what they do really well, but it is hard to use them with the	17
tidyverse or other outside packages	17
- S3 or S4 objects that make it hard to work them into a pipeline where their	17
functions are not the last step	17
• packages that help with interoperability	17
- broom and biobroom: make it easier to put numerous statistical functions	17
into a larger tidyverse workflow	17
- Max Kuhn's caret package for machine learning—adds a layer that lets you	17
use the same interface to work with machine learning algorithms from lots of	18
different packages that otherwise all have slightly different interfaces for calling the algorithm and working with the results.	18
canning the algorithm and working with the results.	18:
10. Develop your own package	18
necessity	18
• innovative idea	18
• novel approach or method	18
• unique and specialized purpose	18
